Water meters are critical in implementing accurate future water usage reporting and possibly allocation. In order to ensure accuracy, UBBNRD follows manufacturers’ minimum installation requirements for specific brands of meters. These requirements are outlined in the following pages of this packet. **The following are some guidelines that can simplify the installation process and ensure you an accurate and useful meter:**

**Minimum distances:** If your current plumbing setup has MORE straight run distance than the minimum required, use that extra distance to install the meter as far away as possible from disturbances (particularly upstream disturbances) to ensure optimum accuracy. Remember, many requirements you will find in this packet are minimum, not optimum.

**Types of Disturbances:** Different flow altering devices (valves, etc) and fittings (elbows) create differing flow conditions. Valves typically produce a jetting flow condition, while fittings such as elbows create a non-jetting flow condition. Also, consider pipe size alterations such as reducers or increasers to exhibit non-jetting and jetting flow conditions, respectively. Most meters have different minimum installation requirements for each type of flow condition, and therefore, you will need to understand what flow conditions will exist in your installation. If you do not plan to install the meter yourself, be ABSOLUTELY SURE that your meter installer is familiar with installation requirements for your particular meter and plumbing situation.

**Choosing the right meter:** If you purchase a propeller type meter it is important that you have it calibrated to the correct inside pipe diameter. As a velocity-sensing device, the principle behind a flow meter is calculating flow volume by using the relationship between inside pipe diameter and flow velocity. An accurate flow volume is calculated by correctly calibrating the meter to the inside diameter of the pipe it is installed in. Also, for irrigation systems, you must purchase a meter model that totalizes in acre-inches (the rate of flow needle will still read GPM flow). This meter will be much more convenient (requiring less calculation) to read for reporting and irrigation management purposes. If applicable (depending on the type of meter) it must contain an anti-reverse feature.

**Maintenance:** Refer to the owner’s manual that comes with your meter and follow maintenance recommendations. Particularly for propeller meters, periodic maintenance is critical to meter life. Keeping a meter in good condition will result in reliable readings that can be used both for reporting purposes and for checking and maintaining an efficient irrigation system. Electronic flow meters also require some maintenance. Batteries must be replaced on a regular schedule to reduce the risk of losing data during the irrigation season. **It is important to check to see if the meter is working each time you start and stop the irrigation system.**

Sincerely,

John Bush,
Water Resources Technician
UBBNRD
The following flow meters are approved for use to record groundwater withdrawals required by the District's Groundwater Management Area Rules and Regulations. An approved flowmeter must be installed when it is required by the District’s Ground Water Management Area Rules and Regulations or when the District is providing cost-share assistance for the flowmeter.

**Meters approved for ALL groundwater measurement applications**

- McCrometer Propeller Flow meters (All models)
- McCrometer McMag3000 Electromagnetic Flow Meter
- McCrometer Dura Mag Electromagnetic Flow Meter
- Geyser Flow Meter (All models)
- ARAD WST - PERCISION – Woltman Silver Water Meter
- ARAD IRT - Irrigation Water Meter
- ARAD High Pressure Hydrometer Globe Type (BM)
- ARAD High Pressure Hydrometer Angle Type (BMA)
- ARAD Octave Ultrasonic
- Senninger Flo-Wise Ag Rotor Meter
- Senninger Flo-Wise Magmeter
- SeaMetrics – AG90 Electromagnetic Insertion Flow Sensor
- SeaMetrics – AG1000/2000-Series Irrigation Magmeter
- SeaMetrics – AG3000 & Valley 3000 Magmeter
- SeaMetrics – WMP104 Plastic Bodied Magmeter (2” & 3” models only)
- Growsmart by Lindsay – IM3000 Magnetic Flow Meter
- Sparling BlueWater Electromagnetic Flowmeter
- Sparling FM31/FT194 Low Pressure Bolt-on Propeller Flowmeter

**Meters approved for non-irrigation applications only**

- Hays Turbine Meter – WP Series
- Master Meter – Multi-Jet Water Meters (5.8” thru 2” sizes)
- GPI Commercial Grade Meters – A100, A200 and N100
- Neptune High Performance Turbine Meter
- Elster AMCO Water evoQ4 Electromagnetic water meter

* Use associated with an irrigation system will be considered on a case by case basis
The following meters are approved for **ALL** groundwater measurement applications

**McCrometer Propeller Flowmeters (all models)**

**Minimum Installation Requirements:**

Flowmeters are velocity sensing devices and are vulnerable to certain upstream disturbances. Because of this, meters need certain lengths of straight pipe runs before and after the meter. These distances usually relate to the diameter of the pipe used. Obstructions can include elbows, valves, pumps, and changes in pipe diameter. The uneven flow created by these obstructions can vary with each system. If your application provides for more than five diameters of upstream run, use the available distance.

- **Minimum Upstream Requirement:** Mc Propeller meters should be installed a minimum of five to ten times the diameter of the pipe downstream of any obstructions. See the diagram and corresponding tables below. The exact upstream straight-pipe requirement is specific to the meter model number.
- **Minimum Downstream Requirement:** Mc Propeller meters should be installed a minimum of one to two times the diameter of the pipe upstream of any obstructions.

For upstream and downstream piping requirements relating to your specific meter, contact your local McCrometer representative. (Please be prepared to provide the serial number of your meter.)

---

**Figure 5. Pipe Run Requirements For Saddle And Tube Style Flow Meters**
McCrometer McMag 3000 Electromagnetic Flow Meter

Straight Pipe Requirements
Flow meters are velocity sensing devices and are vulnerable to certain upstream disturbances. Because of this, meters need certain lengths of straight pipe before and after the meter. These distances relate to the diameter of the pipe used. Obstructions can include elbows, valves, pumps, and changes in pipe diameter. The uneven flow created by these obstructions can vary with each system.

Both upstream and downstream distances are measured from the center of the saddle as shown below.

![Diagram showing straight pipe requirements](image)

In a typical installation, to achieve ±2% accuracy the Mc Mag 3000 flow meter should be installed a minimum of three diameters downstream of most disturbances and one diameter upstream of most disturbances. Accuracy of ±1% is available in many applications with a Factory consultation prior to ordering.
McCrometer Dura Mag Electromagnetic Flow Meter

Available Sizes: 4” to 12”

Minimum Installation Requirements:

Jetting and Non-jetting flow - Minimum distance from both jetting and non-jetting flow disturbances is 2 pipe diameters upstream and 1 pipe diameters downstream of the flow meter.

Geyser Flow Meters (All models)

Minimum Installation Requirements:

Non-jetting flow - Minimum installation distance for non-jetting flow is 5 pipe diameters upstream and 2 pipe diameters downstream of the propeller. (Examples of things that may cause non-jetting flow include turbine pumps, pipe elbows, cooling coils).

Jetting flow - Minimum installation distance for jetting flow is 10 pipe diameters upstream and 2 pipe diameters downstream of the propeller. (Examples of things that may cause jetting flow include pressure regulating valves, check valves and other in pipe restrictions).

Straightening vanes are required for Geyser installations with a straight pipe run of 10 pipe diameters or less. (Straightening vanes are recommended on all installations).

ARAD WST - PERCISION – Woltman Silver Water Meter (NETAFIM USA)

Minimum Installation Requirements:

Jetting and Non-jetting flow - Minimum distance from both jetting and non-jetting flow disturbances is 5 pipe diameters upstream and 2 pipe diameters downstream of the flow meter.
ARAD IRT - Irrigation Water Meter *(NETAFIM USA)*

Minimum Installation Requirements:

Jetting and Non-jetting flow - Minimum distance from both jetting and non-jetting flow disturbances is 10 pipe diameters upstream and 5 pipe diameters downstream of the flow meter.

D = Pipe Diameter
"6" pipe: D=6 in
"8" pipe: D=8 in
"10" pipe: D=10 in

ARAD High Pressure Hydrometer Globe Type (BM)

Minimum Installation Requirements:

Jetting and Non-jetting flow - Minimum distance from both jetting and non-jetting flow disturbances is 1 pipe diameter upstream and 0 pipe diameters downstream of the flow meter.

D = Pipe Diameter
"6" pipe: D=6 in
"8" pipe: D=8 in
"10" pipe: D=10 in

ARAD High Pressure Hydrometer Angle Type (BMA)

Minimum Installation Requirements:

Jetting and Non-jetting flow - Minimum distance from both jetting and non-jetting flow disturbances is 3 pipe diameters upstream and 2 pipe diameters downstream of the flow meter.
ARAD – Octave Ultrasonic Water Meter

Minimum Installation Requirements:

The water meter can be installed in any position
The meter must be full with water all the time
No special requirements for installation
Senninger Flo-Wise Ag Rotor Meter & Senninger Flow-Wise Magmeter

Minimum Installation Requirements:

**Jetting and Non-Jetting Flow** - Minimum installation distance is 5 pipe diameters upstream and 2 pipe diameters downstream of the flow meter in both jetting and non-jetting flow circumstances.

The Senninger Flo-Wise SC Ag Rotor Meter does not require straightening vanes.

SeaMetrics - AG1000/2000-Series Irrigation Magmeter

Minimum Installation Requirements:

**Non-jetting flow (90 degree elbow)** – The Seametrics AG 1000/2000 Series meter can be installed directly behind an elbow or well discharge. Where available, optimal installation distance for non-jetting flow is at least 2 pipe diameters upstream and 1 pipe diameter downstream of the flow meter.

Jetting flow – The Seametrics AG 1000/2000 Series meter can be installed directly behind a jetting flow disturbance. Where available, optimal installation distance for jetting flow is at least 5 pipe diameters upstream and 1 pipe diameters downstream of the flow meter. (Examples of things that may cause jetting flow include pressure regulating valves, check valves and other in pipe restrictions).

The AG1000/2000 Series Irrigation Magmeter does not require straightening vanes.
SeaMetrics – AG3000 & Valley 3000 Magmeter

Minimum Installation Requirements:

**Non-jetting flow (90 degree elbow)** – The Seametrics AG 3000 & Valley 3000 Series meter can be installed directly behind an elbow or well discharge. Where available, optimal installation distance for non-jetting flow is at least 2 pipe diameters upstream and 1 pipe diameter downstream of the flow meter.

Jetting flow – The Seametrics AG 3000 & Valley 3000 Series meter can be installed directly behind a jetting flow disturbance. Where available, optimal installation distance for jetting flow is at least 5 pipe diameters upstream and 1 pipe diameters downstream of the flow meter. (Examples of things that may cause jetting flow include pressure regulating valves, check valves and other in pipe restrictions).

The AG1300 & Valley 3000 Series Irrigation Magmeter does not require straightening vanes.

SeaMetrics – AG90 Electromagnetic Insertion Flow Sensor

Minimum Installation Requirements:

Initial programming setup will need to be performed by an official SeaMetrics dealer.

Choose a position that will ensure a full pipe. Choose a position that will minimize flow distortion.

Flow Straightening Vanes/Conditioners

1. If you have the bolt-in, 3-vane style they may be removed or left in place. They do not affect performance.
2. If you have the 6-vane, bolt-in style with a cone, it should be removed.
3. For 6-vane, weld-in style installed in a spool, turn the spool 180° and reinstall with the vanes behind the meter.
4. Orifice, tube or Vortab style conditioners will not affect performance.
Seametrics – WMP104 Plastic Bodied Magmeter (2” & 3” models)

Minimum Installation Requirements: *Diagrams taken from document LT-65650290r1.2 20161006_10/6/16*

Reduced Pipe

Expanded Pipe

Elbows

Swirling Flow: Partially Open Butterfly Valve

**Full Pipe Recommendations**

Possible Problem

Better Installation

*Allows air pockets to form at sensor*

*Ensures full pipe*

*Post-valve cavitation can create air pocket*

*Keeps pipe full at sensor*

*Air can be trapped*

*Allows air to bleed off*
**Meter Positioning**

It is important to install flowmeters so the readings are always accurate. The meters are designed to give a zero reading, should one or more electrodes become exposed. Air bubbles and sediment in the pipe can cause false readings.

It is preferred that you install the flowmeter in a pipeline location where the pipe will be full when there is flow. Orientate the flow meter in a vertical position (meter positioned on top of the pipe) as well. Never install the flowmeter with the meter horizontal to the pipeline or below the pipe. The following diagram shows proper and improper meter positioning.

**NOTE:** Meters may be clocked up to 45° if necessary.
Straight Pipe Recommendations

In order to achieve optimal meter accuracy and performance, it is necessary to provide sufficient lengths of straight pipe upstream and downstream from the IM3000 Flowmeter. The following are common examples of installation conditions and recommended minimum straight pipe lengths. These serve as general guidelines and do not cover all possible conditions or any specific local regulatory requirements. If there is a question with regards to a specific installation configuration, please contact the manufacturer for further support.

Pipe Elbow, Valve and Pump

NOTE: Valve denotes a fully open butterfly or gate valve. When installed with a pump, the IM3000 should always be located downstream of the pump discharge. Installing meters upstream of a pump intake is generally not recommended.

Updated March 20, 2018

Summary:
This notice is to inform you that Lindsay has conducted thorough, controlled testing on the performance of the Growsmart IM3000 flowmeter when close-coupled to 1) a 90-degree pipe elbow, 2) a vertical turbine discharge head, and 3) a swinging disc check valve. In each of these cases, the IM3000 was able to demonstrate +/- 2% accuracy, despite having zero straight pipe upstream of its installation.

Background and Details:
Installing any make/model of electromagnetic flowmeter with manufacturer recommended distances of upstream straight pipe is necessary for the meter to achieve its optimal accuracy. The IM3000 is capable of +/-1% measurement accuracy, when installed according to the straight pipe recommendations specified by the Growsmart Installation manual, which is typically 2 pipe diameters (PD) upstream of the meter.

However, in certain agricultural installations, the piping configuration does not provide sufficient straight pipe. Lindsay has conducted thorough testing on the commonly seen installations below, and determined that in each case, the meter accuracy remains within +/-2%.
Sparling BlueWater Electromagnetic Flowmeter

Minimum Installation Requirements:

3.2 Site Selection
Select a pipe location that will always be full of liquid. The equipment should be located where the flowmeter will be accessible for adjustment. Provide a minimum of 18" clearance to the electronics enclosure.

The meter may be located in any position from vertical to horizontal. Flow may be in either direction through the meter. When installing in a vertical direction, however, upflow of fluid is preferred to assure a full pipe condition.

![Figure 3.1](image)

Horizontal installation requires that the sensing electrodes be positioned in the horizontal plane. See Figure 3.7.

Provide at least three pipe diameters of straight piping approach between an upstream elbow and the midpoint of the meter. More straight approach should be provided after valves or multiple elbows. Provide at least 10 diameters after expanders or laterals which are of smaller diameter than the line size.
Sparling FM31/FT194 Low Pressure Bolt-on Propeller Flowmeter

Minimum Installation Requirements:

3.1 Site Selection Criteria

Choose a location that assures a pipe full of water flowing at or above minimum velocity for the meter. There should not be any enlargements, diffusers or obstructions upstream that would produce a jet or spiraling flow into the meter. 10 diameters of straight pipe upstream and 1 diameter downstream are recommended to avoid errors caused by skewed velocity profiles. See Figure 3.1

A jet caused by a partially opened valve, a centrifugal pump, or a pipe enlargement upstream from the meter can cause inaccurate registration.

Often such disturbances can be avoided by locating the meter on the suction side of the pump. The meter will register just as efficiently on a vertical or slanting pipe as on a horizontal line. The straightening vanes eliminate cork-screw effects in the flow profile. Flow conditioners may be required in installations where less than optimum conditions exist. See Figure 3.1

Figure 3.1
Installation Considerations
The following meters are approved for non-irrigation applications only:

Elster AMCO Water evoQ4 Electromagnetic water meter

Minimum Installation Requirements:

- The pipe must always be filled completely with the flowing fluid.

When installing the meter on vertical piping, make sure to mount it on a pipe section in which the fluid flows upwards.

- A straight section of the pipe is recommended for meter installation.

During fully open position using various valves; the meter can be fixed directly to a gate valve being fully opened.

Applicable to various control valves, such as butterfly and ball valves.

Be sure to install control valves towards the lower end of the downward flow as possible.
Hays Turbine Meter - WP Series
Minimum Installation Requirements:
Minimum installation distance is 5 pipe diameters upstream and 3 pipe diameters downstream of the flowmeter.

Master Meter – Multi-Jet Water Meters (5/8” thru 2” sizes)
Minimum Installation Requirements:
A low pressure loss shutoff valve must be installed upstream and downstream of the meter.
The meter must be installed in horizontal plane, with the register upright, in a location accessible for reading, service and inspection.
Manufacturer design and installation instructions must be followed for these meters.

GPI A1 Commercial Grade Meters – A100, A200 and N100
Minimum Installation Requirements:
Avoid installing the meter in electrically “noisy” environments.
Minimum installation distance for A100 and N100 (1” size) is 20 inches upstream and 5 inches downstream of the flow.
Minimum installation distance for A200(2” size) is 40 inches upstream and 10 inches downstream of the flow.

Neptune High Performance Turbine Meter
Minimum Installation Requirements:
Installations without the Neptune strainer require a minimum installation distance of 6 pipe diameters downstream from flow disturbances.
